McCloskey Adds New SDX-95 Telescoping Stacker to Materials Handling Line

SDX-95 stacker maximizes stockpiles without interruption

April 26, 2016 -- Keene, ON CANADA – McCloskey International has introduced a 36"x95' desegregating telescoping stacker, the first off the line making its debut at bauma 2016 in Munich, Germany during the exhibition in April. This is the second product introduced in a new line of self-contained desegregating conveyors to enhance and streamline materials handling.

The new SDX-95 stacker desegregates and maximizes stockpile capacity using a robust, fully automated and highly flexible CAN based control system providing optimal control of material quality. It is capable of 700TPH in applications like aggregates.

Competitively priced, the new SDX-95 is highly portable with an onboard power unit. On-site setup from truck to stockpiling can be accomplished in 15 minutes. The stacker proves to be cost effective for customers removing the need to transport a separate genset or supply mains power on site. Setup from delivery to operation can be accomplished in 15 minutes.

The design of both the SDX-95 and the SDX-130 reflects feedback from customers in a cross-section of applications and industries, and McCloskey International's commitment to deliver the best products based on that input.

“Talking to our customers led to the decision to offer desegregating conveyors to complement our mobile crushing and screening product lines. We will always look at new and innovative ways to develop our products to meet the unique challenges of our customers’ projects around the globe,” said Paschal McCloskey, President and CEO of McCloskey International. “McCloskey’s first product thirty years ago was a stacking conveyor, and we will continue to seek new ways to design and manufacture equipment that exceeds the expectations of our customers.”
